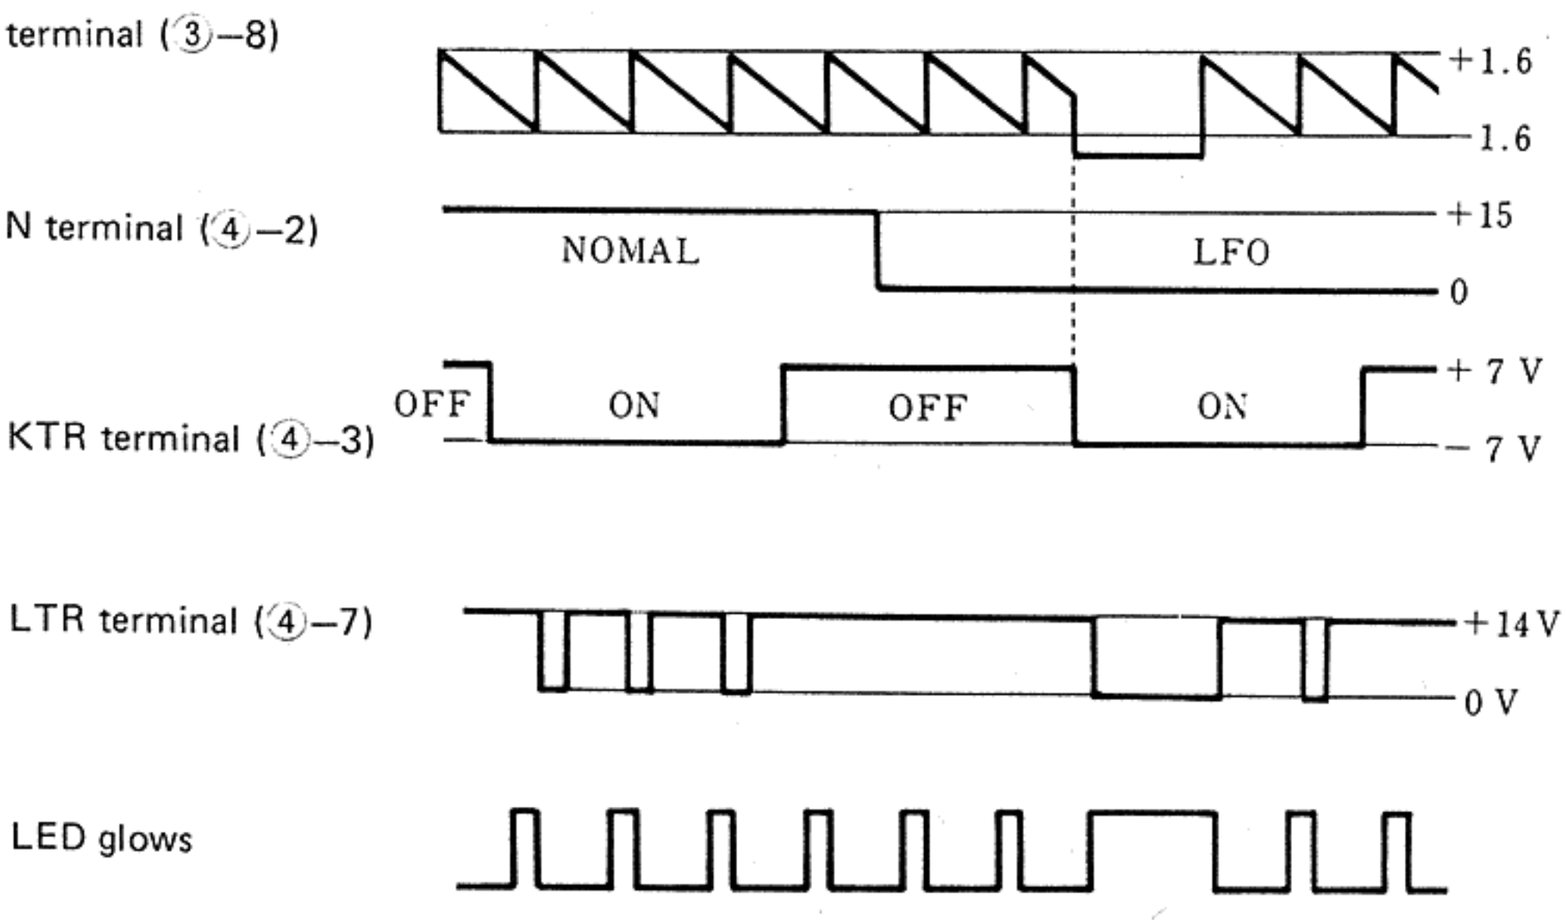
Terminal LTR (④—7) should operate as shown in Fig. 4 under the following conditions:



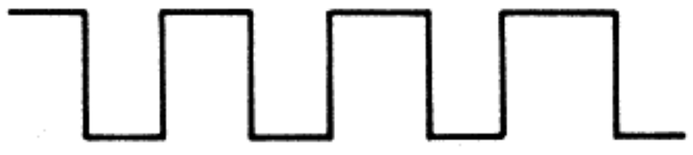
**4. Noise Generator Circuit**

a. Adjust (VR 3) to obtain 5 ± 1 Vp-p (2 dBm) output at terminal NI ( 2 −1).

b. Adjust (VR 4) so that voltage fluctuates at terminal S/H (①−10) to an equal degree above and below 0V as the center, as illustrated below:

Terminal S/H (①−10)

Terminal (⑩−1)



(With LFO speed at 50Hz)

**5. EXT Pre-amplifier Circuit**

a. Set FEET on VCO1 to 8', ∿ VCO1 on VCA1 to 10, and all others to 0, and turn EG/HOLD selector switch to HOLD.

Then, set BALANCE on PN3 to 1 and adjust VOLUME to provide OUTPUT 1 with a 20mV (−40 dBm) output level when key $C_4$ is turned ON (1053Hz output).

Now, connect OUTPUT 1 to EXTERNAL−IN by using a guitar lead (20mV, 1053Hz is applied to terminal ESI (②−7).

b. After the completion of the setting mentioned in paragraph 5−a, 120mV output should be obtained at terminal 0(②−5) when SIGNAL LEVEL (PVR4) is turned to 10. Also, 1.25V output should be presented at terminal −20 (②−3).

**6. EXT Trigger Circuit**

In addition to the same setting as mentioned in paragraph 5−(a), set TRIGGER LEVEL (PVR3) to 10 and −20/0 selector switch on the rear panel to the 0 position. When SIGNAL LEVEL is set so that a voltage of +60 ± 5mV is applied at terminal ETI (④−6), 0 ± 0.2V output should appear at terminal ETO (④−5).

In addition, when SIGNAL LEVEL is set to 0, +15V output should be obtained at terminal ETO.

**1. Amplifier Circuit**

Set the PN3 VOLUME to MAX and make sure that an input signal of about 0.3V is applied to terminals 1I (①–7) and 2I (①–9) respectively when the key is turned ON. Then, adjust [VR1] and [VR2] so that 0.6V signal appears at terminals 1H (①–5) and 2H (①–13) respectively.

At this stage, 100mV output must be obtained from terminals 1L (①–2) and 2L (①–11) respectively, and also 0.6V output from 1 + 2H (②–2) and 50mV output from 1 + 2L (①–15) terminals.

**2. Headphone Amplifier Circuit**

When a set of headphones (8 ohm) is connected to the PHONES jack on PN3, 250mV output should be obtained from terminals HR (②–13) and HL (②–12).

**3. Initial Clear Circuit**

Connect either a set of headpnones or a guitar amplifier, turn the key ON and make sure that a sound is produced. Turn the main switch OFF and then turn it ON after 10 seconds. A sound should be heard about 8 seconds after the main switch has been turned ON.

**4. Foot Controller Current Regulation Circuit**

A +14 ± 1V and −14 ± 1V should be obtained from terminals +X (②–15) and −X (②–14) respectively.
